

THE 5 RIGHTS OF CARE EXECUTION™

One pathway. A concrete validation question.

Can earlier evidence of unresolved care help your team decide who needs help, why, when, and from whom?

DATA / DEVELOPMENT PARTNERSHIP

Begin with a proposed 100–300 historical referral or follow-up episodes. Agree on the data scope, governance, independent review, and recognition dates before analysis. Use approved de-identified or otherwise appropriately governed data under an agreed access arrangement.

Partner deliverable: a pathway-specific report on execution evidence, barriers, detection performance, evaluable timing, and limits.

FOCUSED PAID PILOT

Choose one population, one pathway, and an existing team to act on reviewed signals. Define scope, commercial terms, readiness requirements, and success measures together before launch.

Measure useful signals, false alerts, intervention reach, completed next steps, and staff time. Evaluate utilization and cost only where follow-up and study design support attribution.

Current stage: working MVP and controlled synthetic benchmark evidence. Real-world clinical and financial effects remain to be established.

Which pathway would you start with?

Bring a clinical, care-management, or data leader to a focused partnership conversation.
